Continuation of 11. does NOT place the application in condition for allowance because: Applicant's representative argues that Proakis, Thomas, and Age fail to teach a system exploting multipath differences between received signals in order to spatially demultiplex the received signals.

However, Thomas discloses a method for jointly estimating the frequency response between multiple simultaneously transsmitting devices and each of at least one antenna. The channel frrequency response can be computed to be the weighted sum of the basis functions where each basis function is multiplied by its associated gain and phase weights. The combining weights are computed by reconstructing a set of spatial covariance matrices for all known desired signals plus the receiver-generated noise signal on each subcarrier and time of interest (col. 16, lines 1-45; col. 10, lines 11-55; col. 11, lines 1-27). In addition, the channel transfer ffunction estimates for each desired transmitter on each subcarrier can be used to find weights that cancel out known interference and possibly external interference (col. 17, lines 36-59; col. 18, lines 1-37).

Agee also discloses a method that adapts the antenna array as an intrinsic component of the despreading, linear combining operator. The retroactive mode sets the transmitter antena array weights equal to the conjugated array weights computed during signal reception (col. 15, ines 30-66; col. 16, lines 1-63; col. 21, lines 34-60; col. 22, lines 32-67; col. 23, lines 30-62; col. 27, line 59- col. 28, line 48).

Art Unit: 2682

In response to applicant's argument that there is no suggestion to combine the references, the Examiner recognizes that references cannot be arbitrarily combined and that there must be some reason why one skilled in the art would be motivated to make the proposed combination of primary and secondary references. In re Nomiya, 184 USPQ 607 (CCPA 1975). However, there is no requirement that a motivation to make the modification be expressly articulated. The test for combining references is what the combination of disclosures taken as a whole would suggest to one of ordinary skill in the art. In re McLaughlin, 170 USPQ 209 (CCPA 1971). References are evaluated by what they suggest to one versed in the art, rather that by their specific disclosure. In re Bozec, 163 USPQ 545 (CCPA) 1969. In this case, it would have been obvious for a person having ordinary skill in the pertinent art, at the time the invention was made, to apply the technique of Agee to the modified system of Thomas and Proakis in order to provide an effective means for implementing retro directive antenna arrays by reducing co-channel interference, and minimizing channel variation between the reception and transmission paths.
